Address Verification Service (AVS)

Definition/Description

AVS allows CNP merchants to check the cardholder billing address with card issuer. The merchant includes the AVS request as part of the authorization.

Technical Features/How the Technique Works

A merchant can use AVS during checkout to verify the customer’s billing address and/or zip code against the information on file at the issuer.

AVS can be used as a pre-authorization step known as an ’address verification,’ or the AVS request can be embedded in the authorization request to the issuer.

The issuer responds with either a full match, partial match, or no match. If it is part of an authorization request, the issuer will embed the AVS response within the approval or decline message.

The merchant may use the AVS response to augment the response from the issuer. Most typically, a merchant may choose to decline a transaction, even if the issuer approves the transaction, if the AVS check returns a ’no match.’

Risks Associated with Technique

AVS typically would be used as part of a layered fraud solution. Fraudsters often have access to the cardholder’s address information along with the stolen card credentials, so an AVS match alone should not be accepted as proof of a legitimate transaction.

False positives are a risk. Since AVS requires matching numerical fields in an address, which is often in a non-structured format, false declines are a possibility.
Customer Impact/Level of Friction

The process requires that the customer enter billing information when checking out or when establishing an account with the merchant. The customer needs to be aware of the address on file with the issuer and ensure it is up to date.

Implementation Considerations

Billing information is standard KYC information and capturing it is relatively easy.

Integration is not complicated. Using AVS is a common practice and is incorporated in the existing authorization message infrastructure.

AVS requires a low level of investment and provides a low level of protection. The technique is a standard part of typical CNP risk management and is used as part of a layered approach.

Maturity

AVS has been in use for many years and is a standard tool for addressing CNP fraud risk.

Applicable Industry Standards

Specifications for AVS vary by payment network.

Publicly Available Statistics on Implementations and Use

Statistics are not available for this technique.
